1.

1.1.

Matrix dimension	Matrix type	Exec. time for <code>eig</code> (s)	Exec. time for <code>power_v11</code> , (s)
200×200	Type 1	9.000e-02	1.510e+00
400×400	Type 1	4.000e-02	1.831e+01
600×600	Type 1	6.000e-02	6.021e+01
200×200	Type 2	3.000e-02	3.000e-02
400×400	Type 2	4.000e-02	4.000e-02
600×600	Type 2	7.000e-02	1.700e-01
200×200	Type 3	1.000e-02	5.000e-02
400×400	Type 3	3.000e-02	5.200e-01
600×600	Type 3	7.000e-02	1.270e+00
200×200	Type 4	2.000e-02	1.670e+00
400×400	Type 4	3.000e-02	2.094e+01
600×600	Type 4	6.000e-02	5.456e+01

Table 1: Execution time for different sizes and types of matrices

We can see that the `power_v11` algorithm is generally slower than the `eigen` function especially for the type 2 and 4 matrices.

1.2.

```

1  nb_it = 1;
2  norme = norm(beta*v - z, 2)/norm(beta,2);
3
4  while(norme > eps && nb_it < maxit)
5      beta_old = beta;
6      v = z/norm(z, 2);
7      z = A*v;
8      beta = (v'*z)/(v'*v);
9      norme = abs(beta-beta_old)/abs(beta_old);
10     nb_it = nb_it + 1;
11 end

```

Listing 1: Inner loop of the new algorithm

Matrix dimension	Matrix type	Exec. time for <code>power_v11</code> , (s)	Exec. time for <code>power_v12</code> , (s)
200×200	Type 1	1.960e+00	3.200e-01
400×400	Type 1	1.888e+01	2.660e+00
600×600	Type 1	5.031e+01	7.070e+00
200×200	Type 2	1.000e-02	1.000e-02
400×400	Type 2	7.000e-02	1.000e-02
600×600	Type 2	1.800e-01	4.000e-02
200×200	Type 3	3.000e-02	1.000e-02
400×400	Type 3	6.100e-01	1.100e-01
600×600	Type 3	1.270e+00	2.600e-01

200×200	Type 4	1.530e+00	2.900e-01
400×400	Type 4	2.113e+01	3.060e+00
600×600	Type 4	5.914e+01	6.480e+00

We can see that the `power_v12` algorithm is globally faster than the `power_v11`.

1.3.

The main drawback of the deflated power method is the numerous matrix-vector products required to compute the eigenvectors as well as the fact that each iteration compute only one eigenvalue which can be slow if a lot of eigenvalues are desired.

1.4.

If we apply Algorithm 1 to m vectors, there is no reason for the columns of V to converge to a base. Each vector will converge toward a different projection of the dominant eigenvalue.

1.5.

In Algorithm 2, the matrix H is a smaller matrix, with dimension $n \times m$, therefore, even for larger matrices A , computing the spectral decomposition of H will not be computationally expensive.

1.6.

1.7.

- 1: **function** SUBSPACE ITER V1 (RALEIGH-RITZ PROJECTION)
- 2: **Input** : $A \in \mathbb{R}^{n \times n}, \epsilon, \text{MaxIter}, \text{PercentTrace}$
- 3: **Output** : n_{ev} dominant eigenvectors V_{out} and the corresponding eigenvalues Λ_{out}
- 4: Generate an initial set of m orthonormal vectors $V \in \mathbb{R}^{n \times m}; k = 0; \text{PercentReached} = 0$
- 5: **repeat until** $\text{PercentReached} > \text{PercentTrace} \vee n_{\text{ev}} = m \vee k > \text{MaxIter}$
- 6: $k \leftarrow k + 1$
- 7: Compute Y such that $Y = A \cdot V$
- 8: $V \leftarrow$ orthonormalisation of the columns of Y
- 9: *Rayleigh-Ritz projection* applied on matrix A and orthonormal vectors V
- 10: *Convergence analysis step*: save eigenpairs that converged and update *PercentReached*

1.8.

1.9.

1.10.

Matrix dimension	Matrix type	Flops for subspace_iter0	Flops for subspace_iter1	Flops for subspace_iter2	p (A^p)
200×200	Type 1	2309	263	132	2
200×200	Type 1	2309	263	88	3
200×200	Type 1	2309	263	53	5
200×200	Type 1	2309	263	27	10

When increasing the value of p to compute A^p in `subspace_iter2`, the number of flops to compute the results is : $\text{Flops}(\text{iter2}) \simeq \frac{\text{Flops}(\text{iter2})}{p}$.

1.11.

The accuracy differs because eigenpairs are computed from the columns of new matrix V . However, the firsts columns are recalculated at each step, that will lead to have different approximate size for the new eigenpairs computed. By recomputing them, the quality reduces and diverge from the approximate size of the first one.

1.12.

By freezing the converged columns, the algorithm will not have to recalculate them everytime. Which means that the accuracy for the eigenpairs will be more equal. The first and last will have the same approximate size.

2.

2.1.

Σ_k is of size (k, k)

U_k is of size (q, k)

V_k is of size (p, k)
